

# Midterm Documentation

\*When I did this assignment, my major studio project was started yet.

## Concept

This project is for introducing my logo and my design style. I tried to find a way to show my visual design skill with my logo animation. In this project, I tried to show my visual language skill and visualization of my work process by using jQuery.

## Challenge

Since this motion is very short, I had come up with a way to show it in detail frame by frame. During the research process, I came across a design that introduced detailed information through scrolling animation on the Apple website, and I decided to use it because it would be a good idea to introduce myself and explain my visuals.

## Things that went wrong or didn't work that way you wanted.

I especially paid attention to detailed design elements. I wanted to design navigation buttons on top and bottom of the screens to create functional template. However, my javascript code of bottom navigation did not work. When I checked Google's Inspect, scrolling javascript code always had priority and the order of coding was automatically changed. So I am still working on figuring out that.

## How would you improve this project?

First, I should figure out why the order of javascript coding is changed on the web screen. And, because I learned different types of javascript coding with many Youtube tutorials, managing different jQuery coding took lots of time. So I think I need to get used to managing the coding as a second step.

## Where do you see it in real life (a gallery, an interactive showcase, as part of a marketing campaign...)

It could be used primarily for corporate main web page or product introduction page such as iPhone page.
